

R2020b Simulink Real-Time Major Update

The R2020b release of Simulink Real-Time is a major update with several feature enhancements and a licensing change. This page provides an overview of the updates and capabilities including videos and other resources to help you get started with the latest version of Simulink Real-Time.

IMPORTANT NOTE:

Refer to these mandatory migration instructions in case you upgrade your existing target machine to the latest R2020 release: [Target machine migration](#)
(not required if your target machine was delivered with R2020b already)

R2020b introduces **a major update** to Simulink Real-Time, including a new 64-bit real-time operating system. To migrate from R2020a or before to R2020b or after, a few migration steps are required to perform.

We also support a dual-boot option to enable the use of multiple releases. Dual-boot is not recommended in case you plan to work with R2020b or after only as it reduces the available disk space for data logging.
